📄

Write a C++ console program that asks the user to enter their name, stores at least 10 homework excuse templates in a vector of strings (using `{name}` as a placeholder), randomly selects one excuse using `rand()` and `srand(time(0))`, replaces `{name}` with the actual input, and prints the final excuse. Include input validation so the program shows an error if the name is empty or contains numbers/special characters.

10:19 PM ↻ ✎ 📄

C++ homework excuse generator program >

Now let's compile and test it:

Ran 2 commands >

All tests pass. Let me present the final file:

Presented file >

All five test cases passed cleanly. Here's a breakdown of what's in the program:

Structure

Part	Detail
<code>isValidName()</code>	Returns <code>false</code> if the string is empty, contains any digit/special character, or is pure whitespace
<code>fillTemplate()</code>	Loops with <code>std::string::find + replace</code> to swap every <code>{name}</code> placeholder
<code>srand(time(0))</code>	Seeds the RNG once at startup so picks differ each run

The screenshot displays the Claude AI web interface. On the left is a sidebar with navigation icons and a list of recent chats, including "Random homework excuse generator". The main area shows a conversation where the user has asked for a C++ program to generate random homework excuses. The assistant has provided a C++ code snippet that uses a vector of excuses and random number generation to pick a random excuse. Below the code, the assistant explains the use of `srand(time(0))` and `rand() % excuses.size()`. The interface also features a "Homework excuse" file card with a "Open in Visual Studio Code" button. At the bottom, there's a status bar indicating the user is out of free messages until 2:40 AM, a "Write a message..." input field, and a "Sonnet 4.6" model selector.

The errors are all caused by the compiler defaulting to C++98/03 mode on your Mac (Apple Clang does this by default). The fixes needed:

1. **Initializer-list for `vector`** → requires C++11
2. **Range-based `for` loops** → requires C++11
3. **Lambda expressions** → requires C++11

The simplest fix is to add `-std=c++11` (or `-std=c++17`) to your compile command. But since your build task is fixed, here's a version rewritten to be **fully C++98 compatible** with no lambdas, no initializer lists, and no range-based loops:

Created a file, ran a command >

Zero warnings, zero errors — compiles clean under strict C++98.

Presented file >

Here's exactly what caused each error and how it was fixed:

Error	Cause	Fix applied
non-aggregate type ... cannot be initialized with an initializer list	<code>= { "...", "..."</code> } syntax requires C++11	Replaced with individual <code>.push_back()</code> calls
range-based for loop is a C++11 extension	<code>for (char ch : name)</code> requires C++11	Replaced with index-based <code>for (size_t i = 0; ...) loops</code>
expected expression on [] (unsigned char c){...}	Lambda expressions require C++11	Replaced <code>std::find_if</code> + lambdas with a plain <code>trim()</code> function using a <code>while</code> loop

The screenshot shows the Claude AI web interface. On the left is a sidebar with a search icon, a list of chat sessions (e.g., "New chat", "Projects", "Artifacts", "Customize", "Code"), and a "Pinned" section. The main area displays a chat conversation. The chat title is "Random homework excuse generator". The user's message is: "Add error handling to my C++ homework excuse generator. It should show an error message if the user presses Enter without typing a name, if the name contains digits or special characters (only letters and spaces allowed), and if the name is longer than 50 characters. After each error, the program should prompt the user to try again using a loop." Claude's response includes a code snippet for a C++ program that generates a random name and a message that says: "The file already has the first two validations built in — I just need to add the 50-character limit check. Here's the minimal change:". Below the message is a code editor showing the C++ code. The code includes a `std::string` variable `name` and a `std::cout` statement that prints the name. The code is highlighted with a yellow background. At the bottom of the interface, there is a text input field with the placeholder "Write a message...", a "Send" button, and a status bar that says "Claude is AI and can make mistakes. Please double-check responses."

Random homework excuse generator

All six tests pass. Let me present the updated file:

Presented file >

The only change was adding five lines inside the existing `while` loop — everything else stayed untouched. Here's what each test confirmed:

Test	Input	Result
T1	Empty (just Enter)	[ERROR] Name cannot be empty
T2	Alice	[ERROR] ... no numbers or special characters
T3	Alice!	[ERROR] ... no numbers or special characters
T4	52-char name	[ERROR] Name is too long (max 50 characters). You entered 52 characters
T5	Exactly 50 chars	Passes — no error
T6	John Smith	Passes — multi-word names still work

The length check intentionally runs **after** the empty check but **before** the character check, so the error messages always stay specific and never overlap.

Random homework excuse generator

```
inner while(true)           ← excuse replay for this student
├── generate & display excuse ← increments excusesForStudent + totalExcuses
├── "Another excuse for X?"
│   ├── y → loop again (same student)
│   └── n → goto done_with_student
└── "Another student?"
    ├── y → outer loop continues (new student)
    └── n → goto end_session
        └── print summary + goodbye
```

Session summary at exit always shows:

```
=====
                Session Summary
=====
Students served : 3
Excuses generated: 4
=====
Goodbye! Good luck to everyone!
```

Two counters do all the tracking — `totalStudents` increments once per student when their name is accepted, and `totalExcuses` increments every time an excuse is displayed.
